Remote Diagnostics Tool (RDT)

Overview:

Desktop Administrators and Helpdesk staff will benefit from using this tool. No Installation is required. Free fully functional Product.

This remote diagnostics tool (RDT) was designed and written to aid in the diagnostics and overall investigation of a remote PC whilst it is on a corporate network, without interrupting the user in their daily work. The tool was originally designed as a replacement to a few different well-known script tools like the "SCCM Client tools" and "Dameware" as we were not allowed to use them on the corporate network anymore. "They were too intrusive".

The aim of interrogating information from the PC like: SCCM execution reports and Installed software lists was the main key but the tool seems to have grown much larger than first anticipated and it now does many other helpful functions as they were requested by people over the years.

Please make sure you are allowed to use this tool on your domain and have read this help file and the disclaimer at the bottom of this file thoroughly before continuing!

This tool was written in VB.Net which requires .NET 4.0 to be on the running Administrators PC (or server) where the tool is being run from. Windows 8/10/11 or Server 2012/2016/2019 has this by default. This tool supports Microsoft Windows OS only.

Any feedback good or bad welcome: Please email RemoteDiagnosticsTool@outlook.com. Improvements and refinements are always being made. Please check the web for a copy of the latest version which may just have the fix or added information you requested already.

Donations Welcome Via Paypal :   We can accept Visa / Mastercard etc…
Thank you for your support. I hope this tool aids your daily remote working and Administration tasks.

Main tool functions:

The tool has been split into many tabs and buttons to ease use of functions as can be seen when launched.

When you launch this tool you will be defaulted to the Main screen once you have entered your required domain login details.
Main connection screen for Adding / Removing / Pinging / Connecting to a PC …… and to be able to interrogate it. (**Right Click in left panel**)

- Pinged Online PC.

- Pinged Offline computer.

- Change your connecting username and password and domain information.

- Force a restart of the remote PC.

- Open the \\ Remote PC \ C$ drive in one click.

- Check the Antivirus version and status of the remote PC.

- Defrag the remote PC C Drive.

- Open the Eventlog of the remote PC.

- Gather information about Microsoft's APP-V client if installed on the remote PC, Version 4.x and 5.x

- Connect to Microsoft's built in "Manage Computer" settings of the remote PC.

- Open the Microsoft "registry editor" so you can connect to the remote PC registry.

- NLTest what logon server the Remote PC used at logon.

- NSLookup machine IP addresses list (Sometimes laptops and tablets have multiple) you can use the IP to connect too.

- Connect to a Microsoft "PowerShell session" on the remote PC.

- RDT registry Editor, Shows HKLM and HKCU (of the logged on user selected on the HOME.)

- Run a Microsoft "RDP connection" to the remote PC.

- tart-up List viewer: gives an overview of all starting actions on the remote PC (Run / Shell / network / print).

- Task Schedule allows you to connect to a remote PC and see what scheduled tasks are setup.

- You Can also run any command specified directly on the remote PC if required. Just enter the command e.g. CMD.EXE /C Del /F /Q C:\temp*.*

- "Shadow Desktop" Button is used to ask a user if you can view their desktop session, so they can show you errors and issues. (MSTSC)

Details   gives general detailed information that used to be displayed.

Interrogates these features:

- *Get basic pc details: (Includes site, Internet Explorer version, JAVA version that is currently plugged into IE, domain, Hardware driver versions for video and network cards, memory and OS values, Etc.*

DISK   when connected to a PC via **right-click "connect > "** button, you can use the DISK tab to interrogate further the partitions and what actual disks are installed on the PC. Check what free space is available. In addition, you can choose to move the swap file to the D or E partition if the space is low on c partition. (NOTE: there is no disk space checking done for the swap file move, if you try to move the swap file to the D partition that doesn't exist you could make the machine NON-bootable, use with caution!)

FType   when connected to a PC via **right-click "connect > "** button, you can use the file types tab to list the machines file types.

Groups   when connected to a PC via **right-click "connect > "** button, you can use the GROUPS tab to list the local groups and add domain groups to local groups / Add local user etc...

Execute   Use this tab to connect to a server share and install (or remove) a package. There are 2 methods that can be used on this tab. 1) Powershell run without a drive letter needed. Copies file to machine (Robocopy) then runs the install locally.

2) Powershell run with a drive letter of choice. Copies file locally (WMI) and then installs locally.

(Setup.exe /s) or package script (install.bat) or (mytestscript.vbs) or (msiexec.exe xxxx.msi /qn) etc can be used.

NOTE: The A: drive mapping is used here by default (can be changed) while it performs the actions.

Please wait for the install / remove to happen, a visible indicator runs whilst these actions are performed.

Note: User messages and pop-ups will halt the install or removal routines. Make sure there no pauses or pop-up messages in the routines. Make sure the routines are "NOT" user interactive before running them.

Please make sure there is enough disk space for these actions before performing them. Be Warned!

Installed   You can use the INSTALLED tab to list the installed software on the PC (same as ADD/REMOVE programs). You can remove selected software from here by the way of a push of a button. Also shows hidden software not listed usually (MSI removal only). Use Install / Remove tab to run package Installs / removals or scripts etc.

MSI   Once connected to a PC via right-click "connect > " button, you can use the MSI List tab to remove a selected MSI.

.NET   Once connected to a PC via right-click "connect > " button, you can use the .NET tab to list any "DotNET Core" or "DotNET Framework" versions installed on the PC.

Patches   Once connected to a PC via right-click "connect > " button, you can use the PATCHES tab to list any "other hotfixes" or "Microsoft KB Patches" installed on the PC and when they got there. Uninstall any KB selected (Win7 or newer only).

Processor   shows a snapshot in time (via perf counters) of CPU usage of the remote PC. (Note: Click the button to manually refresh the list.)

Profiles   Provides details for profiles in use and their sizes. Profile deletion is also available like in AdvancedSystemSettings.

PXE   this is for 1E Nomad and PXE agent diagnostics information.

SCCM   when connected to a PC via right-click "connect > " button, you can use the SCCM tab to find out what SCCM jobs have been run on the remote PC, trigger a "client action task" and many other SCCM tasks including the re-running of an Advert (Machine based or User based).

Execution History provides a list of tried Executions whilst the Advertisements tab provides what packages have been downloaded to the PC. View running SCCM tasks and Client information.

Services

when connected to a PC via right-click "connect > " button, you can use the SERVICES tab to start / stop / set to manual / set to automatic and Delete services on the remote PC. (Use caution when using the Delete Services button as this will delete a service permanently).

Task-Manager

when connected to a PC, you can use the TASK MANAGER tab to list the processes running on the remote PC (via WMI). You can also kill a remote process if required. (Handy for looking to see if the user is running word2010 or excel2003)

User

shows the logged on "users" printers, what network drives they have connected and ODBC Connections the user has setup. Also shown is what keyboard layout they are currently using. Select the user via the "User selection on Begin page".

Active Directory

Readonly - shows All AD Users and Computers – shows All AD Groups – shows selected Group members.

WIM_3rd_Party_Drivers shows the non-Microsoft drivers installed on the Computer

WIM_OptionalFeatures shows the Windows OS Features that are currently installed and that they are Enabled or Disabled.

Print Screen Button

this button will take a snapshot of the RDT application screen when clicked.
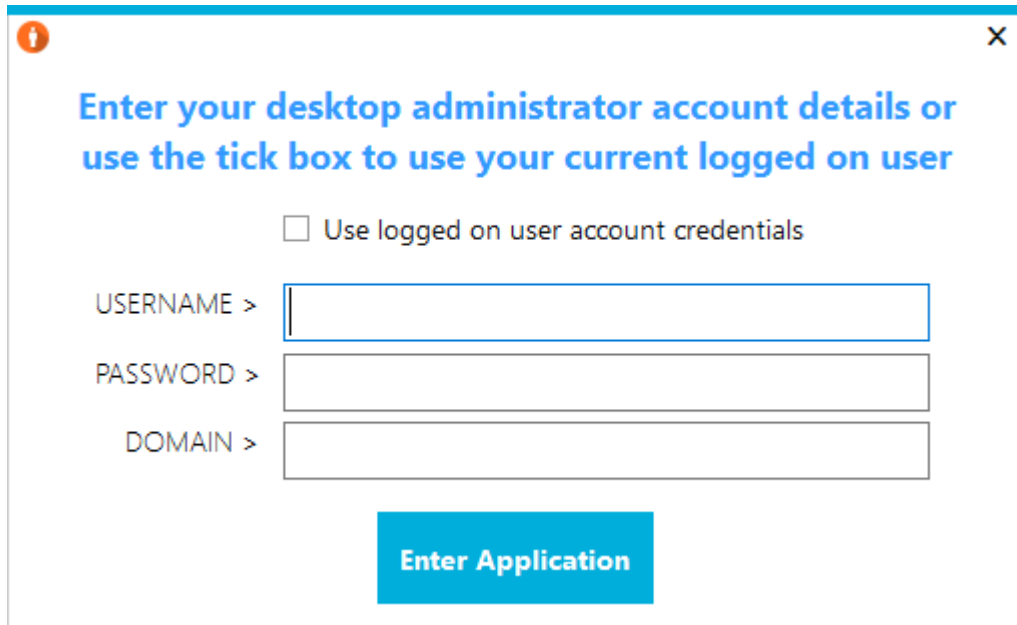

Information Button

displays this help document.

Export to CSV is seen on many pages and can be used to generate an excel export of the tabled information on the page selected. This file is usually saved in a file called %appdata%\export.xls

Example screen shots from the fully unlocked version >

Enter your desktop administrator account details or use the tick box to use your current logged on user

☐ Use logged on user account credentials

USERNAME >

PASSWORD >

DOMAIN >

Enter Application

Note: to use the "logged on Users" details tick the box provided at launch.

WARNING! The "Change Page File" buttons above do not check disk space availability for you. They are brutal and force remote registry key changes on the remote pc. Please check there is enough disk space before moving the page file with the buttons above. Worst case is you could end up 'Blue Screening the PC' and i don't believe you would want that to have to deal with!

Packages   Shortcuts   Connection Groups   APPV5 - HELP

1) "C:\ProgramData\App-V" is the location where the .APPV files are extracted / Installed to by default

2) The Registry.dat for each package is located in the package folders found located in "C:\ProgramData\App-V".
These can be loaded into regedit as normal.

3) The Virtual File Structure is under the VFS Folder of each package located in "C:\ProgramData\App-V", which contains all the files for the virtual package.

3) You can fault find a virtual application by breaking into the virtual application bubble. To do this you'll need some information first.
Example of running a command prompt in a virtual package bubble :- "cmd.exe /appvve:<PACKAGEID_VERSIONID>"
You can get this information from the new Packages table once populated or from a powershell command like this :-
Get-AppvClientPackage -All
or
Get-AppvClientPackage -Name "*Harmonie*" -All

4) Check the package is cached 100% into the APPV Client... or the above commands should return "PercentLoaded" for each app.

5) Check the .APPV file and its user and machine deployment configuration files are not corrupt in the SCCM cache on the PC.

6) APPV5 packages are usually permissioned and Deployed via SCCM by User Groups permissions. Check the user is in the correct group in AD.

7) Check SCCM has the user in the "User Collection". Is there a collection setup correctly for the Application. SCCM polls AD groups to get the users into the collection for deployment.

8) APPV5 loads the users applications at logon time. (remember to log out and in again)

9) Reset or Repair an APPV5 package back to its original settings if needs be. (Not this will erase all user customisations if you do this but will fix missing or deleted shortcuts).
Use the Application Virtualization GUI to repair a package
or use the powershell command :-
Stop-AppvClientPackage "packagename"

[Get APPV5 Package List]   [Get APPV5 Shortcut List]   [Get APPV5 Connection Groups]   [Start a remote Powershell Console]
